

Explain Super Teaching?

Saturday, 29 September 2007

Super Teaching is a Federally qualified technology used to accelerate education in the classroom. Super Teaching is being installed in public school systems, (see www.superteaching.org). Corporate applications are also being developed through ICI, the largest integrator for private, as well as public education, in the world. (ICI is also a DOD approved vendor providing technology to the Department of Defense). Super Teaching is a three screen, software managed learning system that redefines classroom design. Students exit a traditional classroom with a 34% uniformity factor of desired comprehension. Students exit a Super Teaching classroom, corporate or public education, with an 82% uniformity factor. More chemical whole brain impressions are stimulated with ST behind live faculty. The impressions are deeper and more long lasting. No other technology shows equal promise to accelerate human learning. Super Teaching is the first approach to remodeling classroom design since the 12th century, based on hard performance data. If you are interested in installing Super Teaching in your school or in corporate application, please contact the Consortium for Entrepreneur Education for more information. Super Teaching is installed as a public charitable function of our work.
